

# Break a New RSA system

Today, Gerrob's RSA company has featured a New RSA cryptosystem: its public key is  $n$ , the secret keys are three distinct primes  $p$ ,  $q$  and  $r$ , where  $n=p*q*r$ . Note that the ordinary RSA uses only 2 primes! Unfortunately some hackers have stolen a DVD from the company. It does not store the secret keys, only some information about the system, namely, the values of:

$\varphi(n)$  - Euler's totient function and

$\sigma(n)$  - the sum of the divisors.

Obviously you know also  $n$ , because that's public.

Now, Gerrob's RSA employees are trying to determine if hackers will be able to break the system. Could you help them to answer this question?

## Input

The first line contains a single integer  $T$ , the number of test cases, where  $T \leq 20000$ . The following  $T$  lines each contains three numbers  $n$ ,  $\varphi(n)$  and  $\sigma(n)$  in this order. There are 5 input sets.

## Output

Output  $T$  lines, the values of  $p$ ,  $q$  and  $r$  in increasing order. It is guaranteed that  $p, q, r < 10^6$ .

## Example

**Input:**

```
4
30 8 72
61321 54912 68040
451464315257 451286179344 451642497600
91896729624994213 91896040105364880 91897419147616160
```

**Output:**

```
2 3 5
13 53 89
6397 8039 8779
231859 574261 690187
```

**Warning: large input/output data, be careful with certain languages.**

**Warning: A naive algorithm will probably solve only the first input set.**
