

# Cutting out rectangles

We are given some scrap gold pieces shaped as in Picture 1. Dimensions A,B,C,D are given in millimeters. A rectangle, having the largest possible area, is now cut out from this piece. Calculate the area which is left after cutting out such a rectangle.

## Input

Standard input contains  $N$  ( $2 \leq N \leq 20\,000$ ) lines, each containing four values  $A, B, C, D$  ( $0 \leq C \leq A \leq 100\,000\,000$ ,  $0 \leq D \leq B \leq 100\,000\,000$ ) separated by spaces. In line  $N+1$  there are four zeros separated by spaces. Do not process this test case.

## Output

Write  $N$  lines to standard output. Each should contain a single number, equal to the area in square millimeters which is left after cutting out the largest rectangle possible. The relative error of your result should not exceed  $0.000001$ .

## Example

**Input:**

```
11 10 3 6
12 10 2 4
0 0 0 0
```

**Output:**

```
28.00
37.733333
```

## Scoring

For solving this problem you will score 10 points.
