

# Bird tree

## Bird tree

The Bird tree<sup>1</sup> is an infinite binary tree, whose first 5 levels look as follows:

It can be defined as follows:

$$bird = \begin{array}{c} 1/1 \\ \swarrow \quad \searrow \\ 1/(bird + 1) \quad (1/bird) + 1 \end{array}$$

This is a *co-recursive* definition in which both occurrences of *bird* refer to the full (infinite) tree. The expression  $bird + 1$  means that 1 is added to every fraction in the tree, and  $1/bird$  means that every fraction in the tree is inverted (so  $a/b$  becomes  $b/a$ ).

Surprisingly, the tree contains every positive rational number exactly once, so every reduced fraction is at a unique place in the tree. Hence, we can also describe a rational number by giving directions (L for left subtree, R for right subtree) in the Bird tree. For example,  $2/5$  is represented by LRR. Given a reduced fraction, return a string consisting of L's and R's: the directions to locate this fraction from the top of the tree.

## Input

On the first line a positive integer: the number of test cases, at most 100. After that per test case:

- one line with two integers  $a$  and  $b$  ( $1 \leq a, b \leq 10^9$ ), separated by a  $'/'$ . These represent the numerator and denominator of a reduced fraction. The integers  $a$  and  $b$  are not both equal to 1, and they satisfy  $\gcd(a, b) = 1$ .

For every test case the length of the string with directions will be at most 10 000.

## Output

Per test case:

- one line with the string representation of the location of this fraction in the Bird tree.

## Sample in- and output

Input	Output
3	L
1/2	LRR
2/5	RLLR
7/3
