## The mightiest kingdom

## English

Vietnamese

Once upon a time, there were N kingdoms in a far far away land, fighting with each other. King of the mightiest kingdom decided to conquer other kingdoms, looking for oil sources! The kingdom's budget is a bit limited because the money were pumped into the king's latest election campaign. The budget is initially M .

The kingdoms are numbered from 1 to N . Kingdom 1 is the mightiest. The kingdoms are connected by bidirectional roads in which there is exactly once path between any two kingdoms.

The king hired you to make a strategic plan for him. His spies gave you two numbers for each country i (i>1):

- $\mathrm{V}_{\mathrm{i}}=$ the value of this country's oil sources
- $\mathrm{C}_{\mathrm{i}}=$ the cost of conquering this country

A kingdom can be conquered only when it is adjacent to kingdom 1 or when you've conquered an adjacent kingdom to it (which is connected to it via a road).

Now, your task is to make a plan to conquer other kingdoms so that the total value from oil sources is maximized. Never exceed the budget!

## Input

- The first line contains two integers $N(1 \leq N \leq 100)$ and $M(0 \leq M \leq 2000)$.
- The second line contains $N-1$ integers $\mathrm{V}_{2}, \mathrm{~V}_{3} \ldots, \mathrm{~V}_{\mathrm{N}}\left(1 \leq \mathrm{V}_{\mathrm{i}} \leq 100\right)$.
- The third line contains $N-1$ integers $C_{2}, C_{3}, \ldots, C_{N}\left(0 \leq C_{i} \leq 30\right)$.
- Each line in the next $\mathrm{N}-1$ lines contains two integers $\mathrm{u}, \mathrm{v}$ representing a road.

## Output

A single integer that is the maximum value of oil sources the Mightiest King can get from conquering other countries.

## Example

## Input
