

# Arranging Dominoes

[Dominoes](#) have long entertained both game enthusiasts and programmers for quite some time. Many games can be played with dominoes, including multiplayer and single player games. Hari Khan has come up with a single player game. He takes  $N$  boxes and arranges them in a row at positions  $N_1, N_2 \dots N_N$ . Now he has to place  $D$  dominoes ( $D \leq N$ ) in the boxes such that the minimum distance between any two filled boxes is maximized.

## Input

The first line of the input contains an integer  $t$ , the number of test cases.  $t$  test cases follow.

The first line of each test case consists of two integers,  $N \leq 100000$  and  $D \leq N$ , separated by a single space.

$N$  lines follow, each containing a single integer  $N_i \leq 1000000000$ , indicating the location of the  $i^{\text{th}}$  box.

## Output

For each test case, output a single line containing a single integer denoting the largest minimum distance achievable between any two boxes with dominoes.

## Example

**Input:**

```
1
5 3
1
2
3
4
5
```

**Output:**

```
2
```
