## Annoying painting tool

Maybe you wonder what an annoying painting tool is? First of all, the painting tool we speak of supports only black and white. Therefore, a picture consists of a rectangular area of pixels, which are either black or white. Second, there is only one operation how to change the colour of pixels:

Select a rectangular area of $\mathbf{r}$ rows and $\mathbf{c}$ columns of pixels, which is completely inside the picture. As a result of the operation, each pixel inside the selected rectangle changes its colour (from black to white, or from white to black).

Initially, all pixels are white. To create a picture, the operation described above can be applied several times. Can you paint a certain picture which you have in mind?

## Input Specification

The input contains several test cases. Each test case starts with one line containing four integers $\mathbf{n}, \mathbf{m}, \mathbf{r}$ and $\mathbf{c}$. $(1 \leq r \leq n \leq 100,1 \leq c \leq m \leq 100)$, The following $\mathbf{n}$ lines each describe one row of pixels of the painting you want to create. The $\boldsymbol{i}^{\text {th }}$ line consists of $\mathbf{m}$ characters describing the desired pixel values of the $\mathrm{i}^{\text {th }}$ row in the finished painting (' 0 ' indicates white, ' 1 ' indicates black).

The last test case is followed by a line containing four zeros.

## Output Specification

For each test case, print the minimum number of operations needed to create the painting, or - 1 if it is impossible.
