## Common Permutation

Given two strings of lowercase letters, $\boldsymbol{a}$ and $\boldsymbol{b}$, print the longest string $\boldsymbol{x}$ of lowercase letters such that there is a permutation of $\boldsymbol{x}$ that is a subsequence of $\boldsymbol{a}$ and there is a permutation of $\boldsymbol{x}$ that is a subsequence of $\boldsymbol{b}$.

## Input

Input file contains several lines of input. Consecutive two lines make a set of input. That means in the input file line 1 and $\mathbf{2}$ is a set of input, line $\mathbf{3}$ and $\mathbf{4}$ is a set of input and so on. The first line of a pair contains $\boldsymbol{a}$ and the second contains $\boldsymbol{b}$. Each string is on a separate line and consists of at most 1000 lowercase letters.

## Output

For each set of input, output a line containing $\boldsymbol{x}$. If several $\boldsymbol{x}$ satisfy the criteria above, choose the first one in alphabetical order.

## Example

Sample input:
pretty
women
walking
down
the
street

## Sample output:

e
nw
et
