## Partition

A partition of positive integer $m$ into $n$ components is any sequence $a_{1}, \ldots, a_{n}$ of positive integers such that $a_{1}+\ldots+a_{n}=m$ and $a_{1}<=a_{2}<=\ldots<=a_{n}$. Your task is to determine the partition, which occupies the $k$-th position in the lexicographic order of all partitions of $m$ into $n$ components.

The lexicographic order is defined as follows: sequence $a_{1}, \ldots, a_{n}$ comes before $b_{1}, \ldots, b_{n}$ iff there exists such an integer $\mathrm{i}, 1<=\mathrm{i}<=\mathrm{n}$, that $\mathrm{a}_{\mathrm{j}}=\mathrm{b}_{\mathrm{j}}$ for all $\mathrm{j}, 1<=\mathrm{j}<\mathrm{i}$, and $\mathrm{a}_{\mathrm{i}}<\mathrm{b}_{\mathrm{i}}$.

## Input

The input begins with the integer $t$, the number of test cases. Then $t$ test cases follow.
For each test case the input consists of three lines, containing the positive integers $\mathrm{m}, \mathrm{n}$ and k respectively $(1<=n<=10,1<=m<=220, k$ is not larger than the number of partitions of $m$ into $n$ components).

## Output

For each test case output the ordered elements of the sought partition, separated by spaces.

## Example

## Sample input:

1
9
4
3

## Sample output:

1134
