SQL Queries

Structured Query Language (SQL) is a special-purpose programming language designed for manipulating relational data. Its most known feature is perhaps the Query, that is, a mechanism by which data can be retrieved based on custom criteria.

The general syntax to construct a SQL Query with filtering criteria is as follows:

SELECT [list of fields] FROM [table] WHERE [criteria]

Let us review an example. Consider we have the following table of competitive programmers:

Nickname	Country	CF_Rating	TC_Rating
tourist	BY	3205	3693
Petr	RU	2676	3738
Egor	RU	2732	3463
cjtoribio	DO	2019	1381
niquefa_diego	СО	2059	1896
Un_Exisstin3	PE	2400	1499

If we wanted to retrieve all competitive programmers who have a CodeForces rating less than 2200 or a TopCoder rating of at most 1500, we could construct the following query:

SELECT Nickname
FROM Comp_Programmers
WHERE CF_Rating < 2200 OR TC_Rating <= 1500

In this example, the guery would return nicknames citoribio, niquefa diego and Un Exisstin3.

We will consider a simplified SQL statement. Assume there is only one table with the same structure as the one provided in the above example. Your program will receive a single criteria with exactly two conditions on the columns CF_Rating and TC_Rating, assembled with either the AND or the OR operator. With this criteria, your program must output the corresponding nicknames of the retrieved rows.

Input

The first line of input contains M (1 \leq M \leq 50), the number of rows on the table and N (1 \leq N \leq 20), the number of queries to be performed. The next *M* lines contain the rows of the table. Each row is completely described in a single line and contains four tokens separated by single space: Nickname, which is a string of length not exceeding 20; Country, an uppercase string of length 2 consisting of letters [A-Z]; CF_Rating, a positive integer in the range [0, 5000] and TC_Rating, similar to CF_Rating. Nicknames are not unique.

The following N lines contain the list of queries to be performed. Each query is described in a single line. The format of a query is as follows (without brackets):

[CF_Rating | TC_Rating] [< | > | < | > | [positive_integer] [AND | OR] [CF_Rating | TC_Rating] [< | > | < | > | < | > | < | > | < | > | < | > | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < | < |

Output

For each query i enumerated from 1 to N:

- output as its first line "Query #i:"
- output each nickname on a separate line

The list of nicknames must be printed in lexicographical order.

Examples

Input

6 2
tourist BY 3205 3693
Petr RU 2676 3738
Egor RU 2732 3463
cjtoribio DO 2019 1381
niquefa_diego CO 2059 1896
Un_Exisstin3 PE 2400 1499
CF_Rating < 2200 OR TC_Rating <= 1500
CF_Rating > 1 AND TC_Rating >= 3600

Output

Query #1: Un_Exisstin3 cjtoribio niquefa_diego Query #2: Petr tourist
