

Sum of one-sequence

We say that a sequence of integers is a one-sequence if the difference between any two consecutive numbers in this sequence is 1 or -1 and its first element is 0. More precisely: $[a_1, a_2, \dots, a_n]$ is a one-sequence if

- for any k , such that $1 \leq k < n : |a_k - a_{k+1}| = 1$ and
- $a_1 = 0$

Task

Write a program that for each test case:

- reads two integers describing the length of the sequence and the sum of its elements;
- finds a one-sequence of the given length whose elements sum up to the given value or states that such a sequence does not exist;
- writes the result to the standard output.

Input

The number of test cases t is in the first line of input, then t test cases follow separated by an empty line.

In the first line of a test case there is a number n , such that $1 \leq n \leq 10\,000$, which is the number of elements in the sequence. In the second line there is a number S , which is the sum of the elements of the sequence, such that $|S| \leq 50\,000\,000$.

Output

For each test case there should be written n integers (each integer in a separate line) that are the elements of the sequence (k -th element in the k -th line) whose sum is S or the word "No" if such a sequence does not exist. If there is more than one solution your program should output any one.

Consequent test cases should be separated by an empty line.

Example

Sample input:

```
1
8
4
```

Sample output:

```
0
1
2
1
0
-1
```

0
1
