

Sum of Squares

We are interested in how many different sequences of N non negative integers there are that have the sum of their squares less than S . Note that the sequence $(1, 2)$ is different from the sequence $(2, 1)$.

Input

The input consists of only one line with two integers N ($0 < N < 30$) and S ($S < 100$).

Output

A single integer representing the number of different sequences that have the sum of their squares less than S .

Example

Input:

1 4

Output:

2
