## Sums in a Triangle (tutorial)

This is problem SUMITR without strict source limit.
Let us consider a triangle of numbers in which a number appears in the first line, two numbers appear in the second line etc. Develop a program which will compute the largest of the sums of numbers that appear on the paths starting from the top towards the base, so that:

- on each path the next number is located on the row below, more precisely either directly below or below and one place to the right;
- the number of rows is strictly positive, but less than 100;
- all numbers are positive integers between 0 and 99.

## Input

In the first line integer $n$ - the number of test cases (equal to about 1000). Then $n$ test cases follow. Each test case starts with the number of lines which is followed by their content.

## Output

For each test case write the determined value in a separate line.

## Example

Input:
2
3
1
21
123
4

1
12
412
2311

## Output:

5
9
Warning: large Input/Output data, be careful with certain languages
