

# Pasture Walking

*Neal Wu, 2007*

*Points: 200*

The  $N$  cows ( $2 \leq N \leq 1,000$ ) conveniently numbered  $1..N$  are grazing among the  $N$  pastures also conveniently numbered  $1..N$ . Most conveniently of all, cow  $i$  is grazing in pasture  $i$ .

Some pairs of pastures are connected by one of  $N-1$  bidirectional walkways that the cows can traverse. Walkway  $i$  connects pastures  $A_i$  and  $B_i$  ( $1 \leq A_i \leq N$ ;  $1 \leq B_i \leq N$ ) and has a length of  $L_i$  ( $1 \leq L_i \leq 10,000$ ).

The walkways are set up in such a way that between any two distinct pastures, there is exactly one path of walkways that travels between them. Thus, the walkways form a tree.

The cows are very social and wish to visit each other often. Ever in a hurry, they want you to help them schedule their visits by computing the lengths of the paths between  $Q$  ( $1 \leq Q \leq 1,000$ ) pairs of pastures (each pair given as a query  $p_1, p_2$  ( $1 \leq p_1 \leq N$ ;  $1 \leq p_2 \leq N$ )).

## Input

- Line 1: Two space-separated integers:  $N$  and  $Q$
- Lines  $2..N$ : Line  $i+1$  contains three space-separated integers:  $A_i$ ,  $B_i$ , and  $L_i$
- Lines  $N+1..N+Q$ : Each line contains two space-separated integers representing two distinct pastures between which the cows wish to travel:  $p_1$  and  $p_2$

## Output

- Lines  $1..Q$ : Line  $i$  contains the length of the path between the two pastures in query  $i$ .

## Example

### Input:

```
4 2
2 1 2
4 3 2
1 4 3
1 2
3 2
```

### Output:

```
2
7
```

## Output details

Query 1: The walkway between pastures 1 and 2 has length 2.

Query 2: Travel through the walkway between pastures 3 and 4, then the one between 4 and 1, and finally the one between 1 and 2, for a total length of 7.
